Let's Start!

Events on JavaScript

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can say what an event in JavaScript is.
- I can list some events in JavaScript.
- I can talk about characteristics of some events in JavaScript.

Ask your partner:

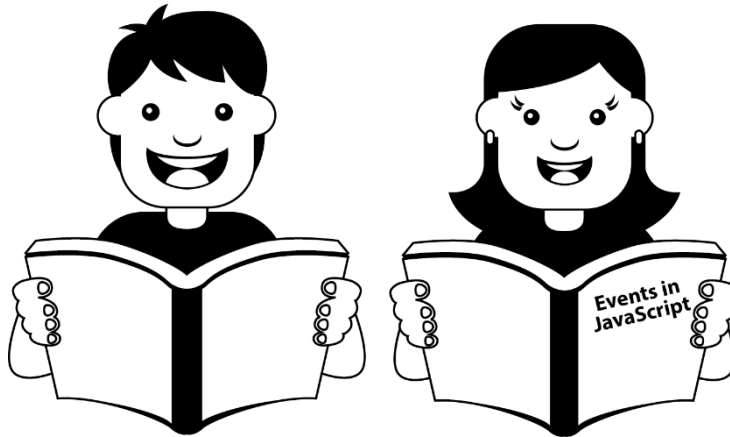

- What do you know about Javascript?
- Have you seen a mobile application?
What is your favorite app?

Let's Explore!

Philip is helping Sam to study for the exam.

Instructions: Read the text below.

Sam: Oh gosh, the exam about JavaScript Events is tomorrow and I just don't understand.

Philip: JavaScript events? Those are easy!

Sam: They are not! I can't even understand what they are!

Philip: They are not as complicated as you believe. Just think of them as any interaction between the user and the browser when they manipulate a page.

Sam: Manipulation of a page?

Philip: Picture this; you always use your computer at night, right? You click a button to open a page, and it loads, there are two events there: first, you clicked somewhere in the page and second the page loaded because you manipulated to do so

Sam: Ok, if that's an event then it's not as hard as I expected. But then basically almost is an event!

Philip: Somehow, you are right. An event is virtually any response of the page to different actions. When you click something, or when you fill a blank to submit any information, or when the mouse is over a button and it turns on, but as soon as you move the mouse, the button turns off.

Sam: So, does the user controls all the events?

Philip: It's not usually as simple as the actions of users, sometimes the actions are produced by programs or browsers, like when the program recognizes that you are working offline and a popup notifies you about it. Or when the program was downloading and it lets you know when it finishes. Or when a program has a failure and needs to be closed.

Sam: And how do they work?

Philip: It's simple. Developers use events to execute coded responses, so any interaction that the user or browser creates will cause a response from the program. There are many events, but you don't always need to learn them all.

Let's Practice!

Events in JavaScript

Instructions: Match column A with Column B.

COLUMN A

1. You _____ events when you use your computer.
2. _____ also create events.
3. The user _____ the events.
4. The user _____ all events, browsers also do it.
5. _____ triggers notifications.

COLUMN B

- a. usually creates
- b. never controls
- c. Sometimes an event
- d. always generate
- e. Sometimes programs

Let's Practice!

You must learn the name of some events in JavaScript.

Instructions: Write the words to correctly complete the sentences. Use words from the box below.

which are not as memorable as / are not as hard to learn as / is not as easy to deduce / as simple as people / is not as complex as.

JavaScript events are not _____ think, but they are very handy. Let's talk about some events that are included in the standard HTML 5. These events _____ they seem, some of them are very common, and sometimes you can deduce what they do by their name, but some other times you really need to know them by heart. For example, the function of `ondragleave` _____ as `onclick`. There are some other events such as `onkeydown`, `onkeypress`, and `onkeyup` _____ other events like `onsubmit` or `onwaiting`; however, they are very common, and as users we trigger them all the time. Working with events _____ working with other features of JavaScript.

Extension Activity

Working with Events in JavaScript

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more information about events in JavaScript.
- Create a brochure with the most common events.
- Describe the characteristics of each event in the brochure.
- Share your brochure with the class.

Self-Assessment

Yes

No

- I identify events in JavaScript.
- I list some events in JavaScript.
- I talk about the characteristics of events in JavaScript.
- I share my work with the class.

Target Words

- **virtually** (adverb): Practically, almost all of something
e.g. An event is virtually any response of the page to different actions
- **popup** (noun): Little windows that pop up when you are interacting with any program
e.g. like when the program recognizes that you are working offline and a popup notifies you about it.
- **notify** (verb): To give information about something to someone
e.g. the program recognizes that you are working offline and a popup notifies you about it.
- **complicated** (adjective): Hard or difficult to do or understand
e.g. They are not as complicated as you believe
- **manipulate** (noun): to control a person or thing
e.g. Just think of them as any interaction between the user and the browser when they manipulate a page.
- **somehow** (adverb): In some way
e.g. Somehow, you are right.

Learning Points

Comparisons with Not As - As

You can use **comparatives** when you want to compare two objects or to express some differences between them.

There are different ways to make a comparison, one of them is by using **not as – as**, this structure must always be used in a negative sentence.

When we want to make comparisons, we can use this structure:

Negative sentence + as + adjective as + another sentence or subject

Examples:

*Working in retail is **not as easy as** some people think.*

*English language is not **as hard as** C#*

She doesn't work as hard as you.

Examples

- *They are not as complicated as you believe*
- *if that's an event then it's not as hard as I expected*
- *It's not usually as simple as the actions of users, sometimes the actions are produced by programs or browsers*

HTML5 Standard Events

There are many events in HTML5 and JavaScript

This chart contains a few of the most common events in HTML5. For all the following attributes the value is Script.

Attribute	Description
offline	It activates when a document goes offline.
onclick	It activates when there is a mouse click.
ondblclick	It activates when there is a double mouse click.
onerror	It activates when an error occurs.
onkeydown	It activates when a key is pressed.
onkeypress	It activates when a key is pressed and released.
ononline	It activates when a documents comes online
onselect	It activates after selecting an element.
onsubmit	It activates after a form is submitted.
onwaiting	It activates when media is paused and it will be resumed.
