Let's Start!

The Importance of Good Writing for JavaScript

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can use script tags for JavaScript.
- I can talk about important attributes for script tags in JavaScript.
- I can talk about case sensitivity in JavaScript.

Ask your partner:

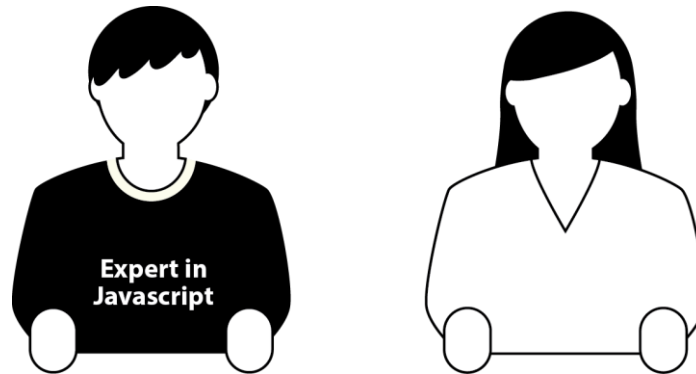

- Why do you think it is important to be very careful when writing code in JavaScript?
- What rules for writing code do you know for JavaScript?

Let's Explore!

Marie and Kyle go through the syntax of JavaScript.

Instructions: Read the text below.

Marie: If I had paid more attention in class, I would have understood Javascript syntax. Kyle, could you help me with this?

Kyle: Sure. Syntax is the group of rules needed for sentence making. In the case of programming languages, syntax isn't very flexible and demands statements to be written painstakingly.

Marie: So, if I follow the rules of syntax, working will be easier for me.

Kyle: Right! When using JavaScript, statements are placed between '`< script >...< /script >`'. These tags can be written anywhere in the web page, however, it's recommendable to keep them within the `< head >` tags. If the browser program reads the `< script >` tags, it'll know it has to interpret this text as a script.

Marie: Ok, I think I'd better jot it down. I know that tags have two attributes: the `l` language that specifies the scripting language I'm using such as javascript and XHTML, among others; and the `type` that specifies the scripting language in use, for instance, `text/javascript`. Any other thing I need to bear in mind?

Kyle: Mmmm, if the programming language is case-sensitive, you need to be aware of capital letters. Do you know what that implies?

Marie: Yes. JavaScript is indeed case-sensitive. Identifiers like language keywords and function names must be written in capital letters in a consistent manner. If the same word is written twice differently, the code will read them as two different elements. So I need to be careful when writing lower and upper case letters. And how we use punctuation is pivotal for the code to work well, isn't it?

Kyle: Yes. Statements are separated by semicolons. If they are in different lines, a semicolon is not needed. That's something you really need to be mindful of. On the other hand, JavaScript doesn't read whitespaces and line breaks, therefore, if you write them, the result won't be any different.

Marie: Typing spaces is where people make most mistakes too. I think I got everything. If I need your help with JavaScript, I'll ask you again. Thank you so much for helping me.

Kyle: You're welcome.

Let's Practice!

Do you want to use tags in Javascripts?

Instructions: Select the incorrect words in the paragraph.

Let me clear up some aspects about JavaScript that you should take into account when writing code.

If you want to include statements in Javascript, you was have to place them within the tags `< script >` and `< / script >`. If you uses these tags, they can goes anywhere within the script. However, if you decide to include them, you will has to make sure that they are within the `< head >` tags. Finally, if the `< script >` tag is present, it will alerts the browser program to interpret the text as a script.

Let's Practice!

What does case-sensitive mean?

Instructions: Read the clues. Complete the crossword.

- JavaScript is considered a _____ language. (HINT: The answer contains two words.)
 - case-insensitive
 - case-sensitive
 - script-sensitive
 - Javascript
- These are always typed in with a consistent capitalization of letters.
 - Javascript
 - Keywords, variables, function names
 - Language
 - Type.
- If the identifiers Time and TIME are present in Javascript, they: (HINT: Remember that Javascript is case-sensitive.)
 - will convey the same meaning.
 - will convey a different meaning.
 - will not be recognized by javascript.
 - will not represent an identifier.
- This is an example that can be used to show how JavaScript is case-sensitive: (HINT: If a word is written in uppercase letters, its meaning will be different from the same word written in lowercase letters.)
 - Summer and SUMMER
 - JavaScript
 - Type
 - Keywords, variables, functions names

Extension Activity

Working on syntax!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about tags in Javascript.
- Create a brochure where you include 5 different tags and their functionality.
- Prepare a presentation with the tags you chose.
- Share your presentation with the class.

Self-Assessment

- I understand tags in Javascript.
- I recognize the attributes of scripts in Javascripts.
- I know what case-sensitive in javascript is.
- I share my work with the class.

Yes

No

☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- **painstakingly** (adverb): to do something taking great care of details
e.g. In the case of programming language, syntax isn't very flexible and demands statements to be written painstakingly.
- **jot something down** (verb): to take note of something
e.g. Ok, I think I'd better jot it down.
- **uppercase** (noun): the larger size of a letter usually used at the beginning of sentences or proper nouns, a synonym of "capital letter"
e.g. So I need to be careful with lower and upper case.
- **semicolon** (noun): the punctuation mark used to separate different ideas but linked to each other, also known as this symbol ";"
e.g. Statements are separated by semicolons.
- **be mindful of** (verb): to keep something in mind, to consider something
e.g. On the other hand, JavaScript doesn't clash with whitespaces and line breaks.

Learning Points

Conditional Sentences With If Clauses- Affirmative Form

A conditional sentence states something that happens, will happen, could have happened or could happen depending on a condition.

Conditional clauses are called like this because they talk about situations that need a condition to be true or not. There are different types of conditional sentences and each of them expresses in different degrees how likely it is for something to take place or how probable was it for something to occur in the past or in an unreal situation.

Conditional sentences are composed of 2 clauses: the '**if clause**' that explains the condition, and the '**main clause**' which presents the result or consequence.

Examples:

If I had used Javascript for the project, I would have gotten a better grade.
Your code will show an error if you forget to write some symbols.

Note that when the '**if clause**' is placed after the '**main clause**' we don't write a coma between both clauses as shown in the last example.

Examples

- *If I follow the syntax rules, working will be easier for me.*
- *If the programming language is case-sensitive, you need to be aware of capital letters.*
- *If I need your help with JavaScript , I'll ask you again.*
- *If I had paid more attention in class, I would have understood Javascript syntax.*

Breaking Down Comments in JavaScript

It is possible to embed comments in JavaScript without affecting the regular operations.

When inputting text in JavaScript, we need to be careful with the syntax so the text and comments don't mix. This is basically done by using certain symbols to embed single or multiple line comments.

JavaScript supports C- and C++- styles. If you want to insert comments in JavaScript, you can use `'//'` or embed the comments in between `'/* text */'`. It is also possible to open with `'<!--'` and close it with `'/-->'`.
