Let's Start!

JavaScript supports conditional statements.

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Ask your partner:

- When do you use a flow chart?
- What conditional statements would you implement in JavaScript?

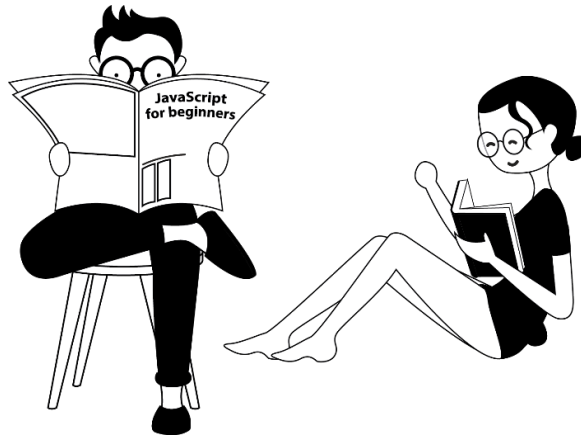

Can Do Statements:

- I can use conditional statements in JavaScript is.
- I can list the different types of conditional statements in JavaScript.
- I can talk about characteristics for the different types of conditional statements in JavaScript.

Let's Explore!

Claire and Max read an article about conditional statements in JavaScript.

Instructions: Read the text below.

Claire: There are some JavaScript statements that are conditionally executed, but I can't manage to understand how they work.

Max: Well, I've been reading this hi-tech magazine that made a review on JavaScript for beginners. They talk about the different conditional statements that JavaScript users can work with when programming.

Claire: It might come in handy to read the magazine. Would it be ok if I borrow it?

Max: Sure, I have it right here. I can help you go through the concepts if you want.

Claire: That'll be great! Let me read the first part. "You might be familiar with the conditional statements. In JavaScript, the "if...else" statements are used to give the program directions on what and how statements should be executed depending on a condition. It might sound difficult, but if you write the code neatly, you won't have any trouble. JavaScript supports three forms of "if...else" statements: the "if" statement, the "if...else" statement, and the "if...else...if" statement. Let's take a look at them."

Max: I'll continue. "The first one is the "if" statement: This is the basic control statement which JavaScript relies on to make decisions. In this kind of statement, if the result is true, the given statement is executed, if it's false, it won't be executed. The second type of 'if' statement is the "if...else" statement. In this case, the expression is evaluated and if it's true, the given statement in the "if" block is executed. If it's false, the statement that was given in the "else" block is executed."

Claire: It seems easy. Let's check the third one. "The last one is the "if...else...if" statement: it's the level-up of the "if...else" statements. Here, JavaScript is able to make a decision out of a number of conditions. It can be described also as a series of "if" statements. The statement is executed based on what the true condition is, and if no condition is true, the "else" block is executed."

Max: Easy, right? Claire: Yes! Now I'll have to try it out to see if I can get the output right.

Claire: Yes! Now I'll have to try it out to see if I can get the output right.

Let's Practice!

Learning about conditional statements might come in handy.

Instructions: Complete the sentences by writing its corresponding word. Use capital letter where necessary. Use: that are, which requires, which users can, which help, which you can choose.

1. There are conditional statements _____ use with JavaScript.
2. Conditional statements _____ used to give the program directions, are a useful tool for executing conditions in programming language.
3. In case you are working with a specific condition, _____ decision making, you can use conditional statements.
4. Conditional statements _____ you to choose a path, are designed to make correct decisions depending on true and false conditions.
5. There are paths _____ from in order to make the correct decision.

Let's Practice!

Characteristics of Conditional Statements

Instructions: Select the correct answers.

1. The 'if statement', _____ considered a fundamental control statement, allows JavaScript to make decisions. Hint: Singular
 - a. which is
 - b. which are
 - c. that are
 - d. have been
2. The result of an evaluation, _____ be true or false, defines if the statement is executed. Hint: Modal verb
 - a. that is
 - b. Which
 - c. which can
 - d. that are
3. The 'if... else statements', _____ the next form of control statements after the 'if statement', help JavaScript execute statements in a more controlled way. Hint: Plural
 - a. which is
 - b. which are
 - c. that can
 - d. which can
4. The 'if... else...if statement', _____ JavaScript to make correct decisions is an advanced form of the "if... else" statement, and it works with different conditions. Hint: Third person
 - a. that help
 - b. that helps
 - c. which is
 - d. which are

Extension Activity

Conditional Statements on JavaScript!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more information about conditional statements in JavaScript.
- Create a brochure where you define the statements and provide examples.
- Prepare a presentation about one of the conditional statements.
- Share your presentation with the class.

Self-Assessment

- | | Yes | No |
|--|-----------------------|-----------------------|
| 1. I understand what conditional statements on JavaScript are. | ☐ | ☐ |
| 2. I list the conditional statements. | ☐ | ☐ |
| 3. I talk about the characteristics of conditional statements. | ☐ | ☐ |
| 4. I share my work with the class. | ☐ | ☐ |

Target Words

- **hi-tech** (adjective): referring to high technology
e.g. I've been reading this hi-tech magazine that made a review on JavaScript for beginners.
- **come in handy** (expression): something useful that might be perfect for a situation
e.g. It might come in handy to read the magazine.
- **neatly** (adverb): something done in a very careful, organized and clean way
e.g. It might sound difficult, but if you write the code neatly, you won't have any trouble.
- **rely on** (verb): to trust someone or something, to depend on something
e.g. The basic control statement which JavaScript relies on to make decisions.
- **level-up** (noun): the next level or the improved version of something
e.g. The last is the "if...else...if" statement: it's the level-up of the "if...else" statements.
- **try something out** (verb): to use something, usually for the first time, to see how it works
e.g. I'll have to try it out to see if I can get the output right.

Learning Points

Modals of Speculation: Might

We can use certain **modal verbs** to make assumptions or speculations about something.

In English language, we can use modal verbs to express necessity, obligation, probability and speculation, among others. In this learning point, we are going to talk about modal verbs that indicate speculation. We can speculate about a situation when we consider or believe something is, was, or is going to take place in a certain way.

Some common modal verbs we can use to speculate are: Can, could, may and **might**.

To use a modal to make a speculation you only have to follow this structure:

Subject + **modal verb** + **main verb** + complement

Examples:

*It **might be** better to learn how the 'if statements' work first.*

*It **might have been** easier to start with the simple form of 'if statements'.*

*We **might be reviewing** 'if statements' next session.*

Note that we can use modal verbs with different tenses depending on our intention and the period of time we are referring to.

Examples

- *It **might come** in handy to read the magazine.*
- *You **might be** familiar with the conditional statements.*
- *It **might sound** difficult, but if you write the code neatly, you won't have any trouble.*

Learning Points

Flowchart of How the If Else Statement Works

The **if-else** statements in JavaScript help people build results based on controlled conditions.

To understand the basics of how the conditional statements in JavaScript work, take a look at the following chart.
